Prototype Wiki

The API used in the prototype is the OMDb API that is used to obtain basic movie information such as the movie's title, poster, genre, ratings, and runtime. For this prototype, the search criteria is simply a movie or tv show's title. The summary results display the poster and title of movies and tv shows that match the keyword(s) used in the search. Each film's poster and title is linked to the film's specific details page, and so when the user clicks into a film, it is routed to a separate page that displays detailed results such as the film's plot, ratings, genre, actors, and runtime.

For instance, if a user searches using the term "star wars", then they will first see a list of ten Star Wars movies with the first entry being "Star Wars: Episode IV - A New Hope". If the user then clicks into this entry, then they will be brought to a separate page in which they can view detailed information about the movie.
